CustomThemeListActivity.java
onListItemClick()
response = HttpStreamer....getStringFromUrl(...)
settings.setCustomTheme(response)
Line 133
[All params of getStringFromUrl() are defined within the class. The "response" string contains a JSON object formatted as a string, fetched from the internet. It is predefined and cant be tainted.]

CustomThemeListActivity.java
OnActivityResult()
path = Intent.getStringExtra(RESULT_PATH)
[RESULT_PATH is set in FileDialogActivity.java, when an Intent is fired in OnListItemClick(). RESULT_PATH is a constant string, which is the path of the selected file, and thus cant be tainted]

The data into the SINK, flows either from the internet, or it is the path of a file being selected. Thus, both of them don't flow from the SOURCE, and so we classify the flow as FALSE POSITIVE

response

path

ApplicationSettings.java
setCustomTheme(jsonData)
GenericThemeEntry.customTheme(jsonData,...)
preferences.putString(...) *[Later accessed by getTheme()]*
